1) Absolute maximum rating without damage on the converter, but it isn't recommended;

2) Efficiency is measured In nominal input voltage and rated output load;

3) The capacitive loads of positive and negative outputs are identical;

4) We suggest to connect an external electrolytic capacitor if there is a spike voltage at the input, details please refer to application circuit.

Recommended test circuit

Typical application

All the DC/DC converters of this series are tested according to the recommended circuit (see Fig. on the right) before delivery. If it is required to further reduce input and output ripple, properly increase the input & output of additional capacitors C_{in} and C_{out} or select capacitors of low equivalent impedance provided that the capacitance is no larger than the max. capacitive load of the product.
