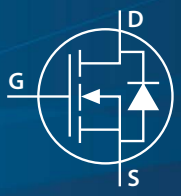
EPC2305 – Enhancement Mode Power Transistor

V_{DS} , 150 V
$R_{DS(on)}$, 2.2 mΩ typ



EFFICIENT POWER CONVERSION

RoHS Halogen-Free

General Description

The EPC2305 is a 150 V eGaN® power transistor in a low inductance 3 x 5 mm QFN package with exposed top for excellent thermal management.

The thermal resistance to case top is ~0.2 °C/W, resulting in excellent thermal behavior and easy cooling. The device features an enhanced PQFN "Thermal-Max" package. The exposed top enhances top-side thermal management and the side-wettable flanks guarantee that the complete side-pad surface is wetted with solder during the reflow soldering process, which protects the copper and allows soldering to occur on this external flank area for easy optical inspection.

Compared to a Si MOSFET, the footprint of 15 mm^2 is less than half of the size of the best-in-class Si MOSFET with similar $R_{DS(on)}$ and voltage rating, Q_G and Q_{GD} are significantly smaller and Q_{RR} is 0. This results in lower switching losses and lower gate driver losses. In summary, EPC2305 allows the highest power density due to enhanced efficiency, smaller size, and higher switching frequency for smaller inductor and fewer capacitors.

The EPC2305 enables designers to improve efficiency and save space. The excellent thermal behavior enables easier and lower cost cooling. The ultra-low capacitance and zero reverse recovery of the eGaN® FET enables efficient operation in many topologies. Performance is further enhanced due to the small, low inductance footprint.

Application Notes:

- Easy-to-use and reliable gate, Gate Drive ON = 5 V typical, OFF = 0 V (negative voltage not needed)
- Top of FET is electrically connected to source

EPC2305
Package size: 3 x 5 mm

Features

- 150 V
- 2.2 mΩ typical
- 3 x 5 mm QFN Package

Applications

- High frequency DC/DC
- AC/DC Chargers and Adaptors
- BLDC Motor Drive
- eMobility Motor drives
- Solar Optimizer & MPPT
- Synchronous Rectification for chargers, adaptors, power supplies
- Class D Audio
- Fast charging for phone & notebook, gaming PC
- DC/DC and chargers for eMobility, power tools, vacuum cleaners

Benefits

- Ultra High Efficiency
- No Reverse Recovery
- Ultra Low Q_G
- Small Footprint
- Excellent Thermal

LAYOUT CONSIDERATIONS

GaN transistors generally behave like power MOSFETs, but at much higher switching speeds and power densities, therefore layout considerations are very important, and care must be taken to minimize layout parasitic inductances. The recommended design utilizes the first inner layer as a power loop return path. This return path is located directly beneath the top layer's power loop allowing for the smallest physical loop size. This method is also commonly referred to as flux cancellation. Variations of this concept can be implemented by placing the bus capacitors either next to the high side device, next to the low side device, or between the low and high side devices, but in all cases the loop is closed using the first inner layer right beneath the devices.

A similar concept is also used for the gate loop, with the return gate loop located directly under the turn ON and OFF gate resistors.

Furthermore, to minimize the common source inductance between power and gate loops, the power and gate loops are laid out perpendicular to each other, and a via next to the source pad closest to the gate pad is used as Kelvin connection for the gate driver return path.

The **EPC90143 Half-Bridge Development Board Using EPC2305** implements our recommended vertical inner layout.

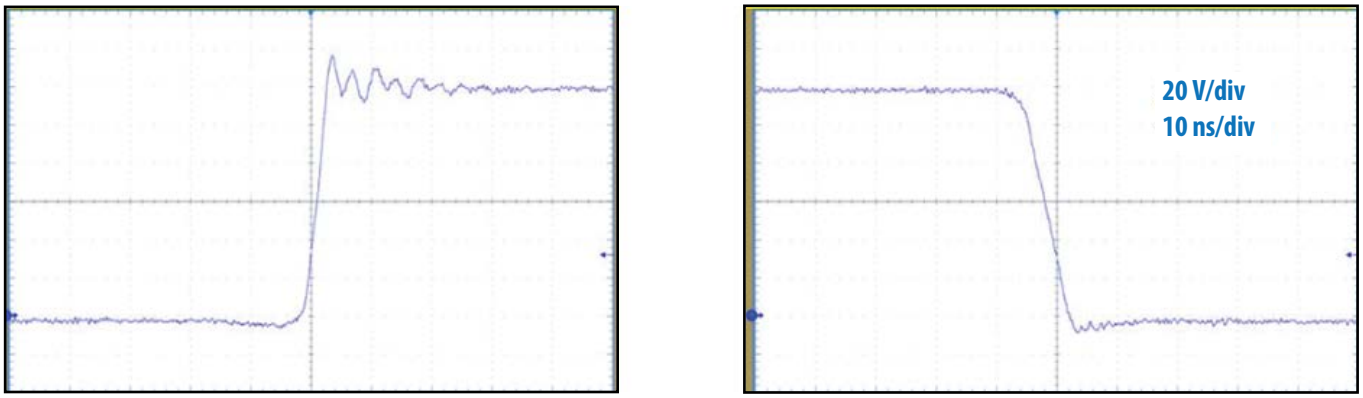
Detailed recommendations on layout can be found on EPC's website: **Optimizing PCB Layout with eGaN FETs.pdf**

TYPICAL SWITCHING BEHAVIOR

The following typical switching waveforms are captured in these conditions:

- **EPC90143: 150 V, 25 A Half-bridge Development Board**
- Gate driver: NCP51820 with 2.5 Ω/5 Ω Pull-Down/Pull-Up Resistance
- External $R_G(ON) = 3.3\ \Omega$, $R_{G(OFF)} = 0.47\ \Omega$
- $V_{IN} = 120$ V, $I_L = 30$ A



Typical turn ON: 35 V/ns **Typical turn OFF: 14 V/ns**

See the **EPC90143 Half-Bridge Development Board Using EPC2305 Quick Start Guide** for more information.

TYPICAL THERMAL CONCEPT

The EPC2305 can take advantage of dual sided cooling to maximize its heat dissipation capabilities in high power density designs. ***Note that the top of EPC FETs are connected to source potential, so for half-bridge topologies the Thermal Interface Material (TIM) needs to provide electrical isolation to the heatsink.***

Recommended best practice thermal solutions are covered in detail in **How2AppNote012 - How to Get More Power Out of an eGaN Converter.pdf**.

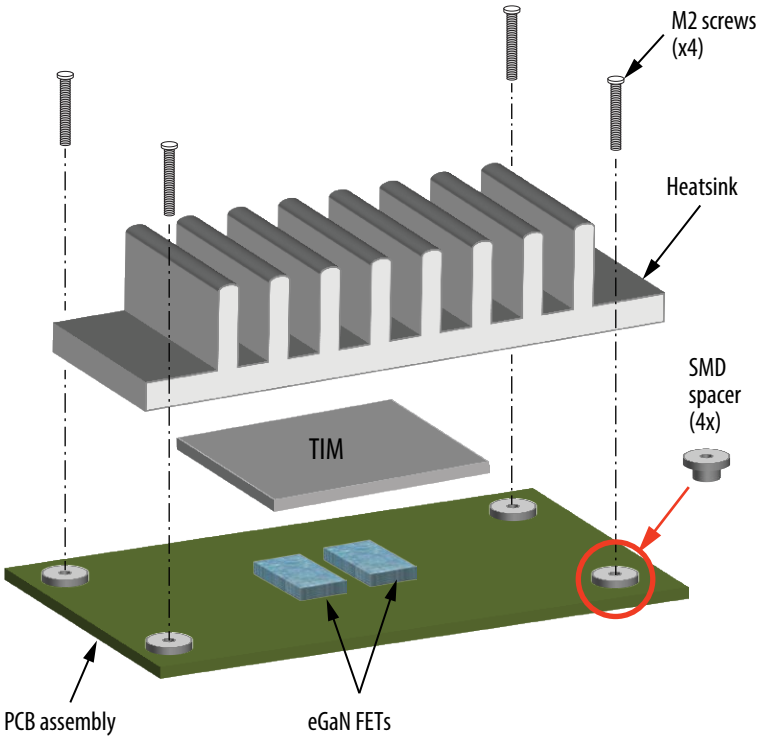

Figure 16: Exploded view of heatsink assembly using screws

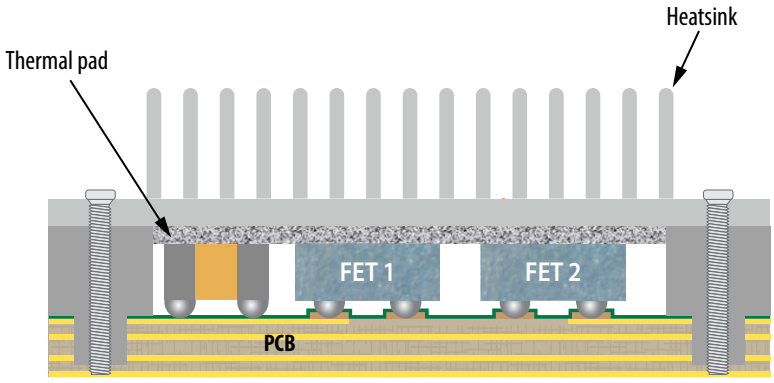

Figure 17: A cross-section image of dual sided thermal solution

Note: Connecting the heatsink to ground is recommended and can significantly improve radiated EMI

The thermal design can be optimized by using the ***GaN FET Thermal Calculator*** on EPC's website.

Stencil opening

Recommended stencil should be 4 mil (100 µm) thick, must be laser cut, openings per drawing. Intended for use with SAC305 Type 4 solder, reference 88.5% metals content.

The corner has a radius of 0.1.

Split stencil design can be provided upon request, but EPC has tested this stencil design and not found any scooping issues.
