

DATASHEET

Low Power DRAM (LPDDR4 FBGA)

D1611PM3BDGUI-U B3221PM3BDGUI-U B3221PM3BDGVIW-U C3212PM3BDGUI-U Q6422PM3BDGVK-U

Specifications

- Die Density: 16Gbits
- Organization
 - x 16 bits: 128M words x 16 bits x 8 banks
 - 2 pieces of 16Gb (x16) in one package (For 32Gb case)
 - Row Address: R0 ~ R16
 - Column Address: C0 ~ C9
- Package
 - 200-ball FBGA
- Power supply
 - VDD1 = 1.8V (1.70V to 1.95V)
 - VDD2, VDDCA and VDDQ = 1.1V (1.06V to 1.17V)
- Data rate:
 - 4266Mbps max. Backward compatible
- Eight internal banks per channel for concurrent operation
- Burst lengths (BL): 16, 32 and on-the-fly
 On the fly mode is enabled by MRS
- Programmable RL (Read Latency) and WL (Write Latency)
- Precharge: auto precharge option for each burst access
- Programmable driver strength
- Refresh: auto-refresh, self-refresh
- Refresh cycles: 8192 cycles/32ms
 Average refresh period: 3.9µs
- Operating temperature range
 - TC = -25° C to $+85^{\circ}$ C (Standard)
 - TC = -40°C to +95°C (Industrial Temperature)

(1024Mx16bitsx1channel) (1024Mx16bitsx2channel) (1024Mx16bitsx2channel) (2048Mx16bitsx1channel) (2048Mx16bitsx2channel)

Features

- Low power consumption
- Per Bank Refresh
- Partial Array Self-Refresh (PASR)
 - Bank Masking
 - Segment Masking
- Auto Temperature Compensated Self-Refresh
 (ATCSR) by built-in temperature sensor
- All bank auto refresh and directed per bank auto refresh supported
- Double-data-rate architecture; two data transfers per one clock cycle
- Differential clock inputs (CK_t and CK_c)
- Bi-directional differential data strobe (DQS_tandDQS_c)
- Commands entered on both rising and falling CK_t edge; data and data mask referenced to both edges of DQS_t
- DMI pin support for write data masking and DBIdc functionality

1.1 Pin Function and Descriptions

		Table — Pin Function and Descriptions
Name	Туре	Description
CK_t_A, CK_c_A CK_t_B, CK_c_B	Input	Clock: CK_t and CK_c are differential clock inputs. All address, command, and control input signals are sampled on the crossing of the positive edge of CK_t and the negative edge of CK_c. AC timings for CA parameters are referenced to CK. Each channel (A & B) has its own clock pair.
CKE0_A CKE0_B	Input	Clock Enable: CKE HIGH activates and CKE LOW deactivates the internal clock circuits, input buffers, and output drivers. Power-saving modes are entered and exited via CKE transitions. CKE is part of the command code. Each channel (A & B) has its own CKE signal.
CS0_A CS0_B	Input	Chip Select: CS is part of the command code. Each channel (A & B) has its own CS signal.
CA[5:0]_A CA[5:0]_B	Input	Command/Address Inputs: CA signals provide the Command and Address inputs according to the Command Truth Table. Each channel (A&B) has its own CA signals.
ODT_CA_A ODT_CA_B	Input	CA ODT Control: The ODT_CA pin is used in conjunction with the Mode Register to turn on/off the On-Die-Termination for CA pins.
DQ[15:0]_A, DQ[15:0]_B	I/O	Data Input/Output: Bi-direction data bus.
DQS[1:0]_t_A, DQS[1:0]_c_A, DQS[1:0]_t_B, DQS[1:0]_c_B	I/O	Data Strobe: DQS_t and DQS_c are bi-directional differential output clock signals used to strobe data during a READ or WRITE. The Data Strobe is generated by the DRAM for a READ and is edge-aligned with Data. The Data Strobe is generated by the Memory Controller for a WRITE and must arrive prior to Data. Each byte of data has a Data Strobe signal pair. Each channel (A & B) has its own DQS strobes.
DMI[1:0]_A, DMI[1:0]_B	I/O	Data Mask Inversion: DMI is a bi-directional signal which is driven HIGH when the data on the data bus is inverted, or driven LOW when the data is in its normal state. Data Inversion can be disabled via a mode register setting. Each byte of data has a DMI signal. Each channel (A & B) has its own DMI signals. This signal is also used along with the DQ signals to provide write data masking information to the DRAM. The DMI pin function - Data Inversion or Data mask - depends on Mode Register setting.
ZQ	Reference	Calibration Reference: Used to calibrate the output drive strength and the termination resistance. There is one ZQ pin per die. The ZQ pin shall be connected to VDDQ through a $240\Omega \pm 1\%$ resistor.
VDDQ, VDD1, VDD2		Power Supplies: Isolated on the die for improved noise immunity.
VSS, VSSQ	GND	Ground Reference: Power supply ground reference
RESET_n	Input	RESET: When asserted LOW, the RESET_n signal resets all channels of the die. There is one RESET_n pad per die.

NOTE 1 "_A" and "_B" indicate DRAM channel "_A" pads are present in all devices. "_B" pads are present in dual channel SDRAM devices only.

NOTE 1. ODT_CA for Rank 0 of each channel is wired to the respective ODT ball. ODT_CA for Rank 1 of each channel is wired to VSS in the package.

Simplified State Diagram

Figure — Simplified Bus Interface State Diagram

Note 1: For DDR4 Mobile RAM in the Idle state, all banks are precharged.

1.2 Electrical Conditions

All voltages are referenced to VSS (GND)

- Execute power-up and Initialization sequence before proper device operation is achieved.
- Operation or timing that is not specified is illegal, and after such an event, in order to guarantee proper operation, the DDR4 Mobile RAM Device must be powered down and then restarted through the specialized initialization sequence before normal operation can continue.

1.2.1 Absolute maximum Ratings

			atings		
Parameter	Symbol	min.	max.	Unit	Note
VDD1 supply voltage relative to VSS	VDD1	-0.4	2.1	V	2
VDD2 supply voltage relative to VSS	VDD2	-0.4	1.5	V	2
VDDQ supply voltage relative to VSSQ	VDDQ	-0.4	1.5	V	2
Voltage on any ball relative to VSS	VIN, VOUT	-0.4	1.5	V	
Storage Temperature	TSTG	-55	125	°C	3

Table — Absolute maximum Ratings

Notes:

1. Stresses greater than those listed under "Absolute maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

2. See Power-Ramp section "Power-up, initialization and Power-Off" on section1.4 for relationship between power supplies

3. Storage Temperature is the case surface temperature on the center/top side of the DDR3 Mobile RAM Device. For the measurement conditions, please refer to JESD51-2 standard.

Caution

Exposing the device to stress above those listed in Absolute maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute maximum Rating conditions for extended periods may affect device reliability.

1.2.2 Recommended DC Operating Conditions

Table — Recommended DC Operating Conditions

			U			
Parameter	Symbol	min.	Тур	max.	Unit	Note
Core Power1	VDD1	1.70	1.80	1.95	V	1,2
Core Power2, Input buffer power	VDD2	1.06	1.10	1.17	V	1,2,3
I/O Buffer Power	VDDQ	1.06	1.10	1.17	V	2,3

1. VDD1 uses significantly less current than VDD2.

2. The voltage range is for DC voltage only. DC is defined as the voltage supplied at the DRAM and is inclusive of all noise up to 20MHz at the DRAM package ball.

3. The voltage noise tolerance from DC to 20MHz exceeding a pk-pk tolerance of 45mV at the DRAM ball is not included in the TdIVW.

1.2.3 AC and DC Input Measurement Levels

1.2.3.1 V High speed LVCMOS (HS_LLVCMOS)

	вына шра				
Parameter	Symbol	min.	max.	Unit	Note
AC input logic high	VIH(AC)	0.75*VDD2	VDD2+0.2	V	1
AC input logic low	VIL(AC)	-0.2	0.25*VDD2	V	1
DC input logic high	VIH(DC)	0.65*VDD2	VDD2+0.2	V	
DC input logic low	VIL(DC)	-0.2	0.35*VDD2	V	

Table — LPDDR4 Input level for CKE

Note: 1. See "Overshoot and Undershoot Specifications" on section 1.2.4.

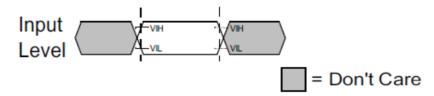

1.2.3.2 LPDDR4 Input Level for Reset_n and ODT_CA

Table — LPDDR4 Input level for Reset_n and ODT_CA

Parameter	Symbol	min.	max.	Unit	Note
Input high level	VIH	0.8*VDD2	VDD2+0.2	V	1
Input low level	VIL	-0.2	0.20*VDD2	V	1

Note: 1. See "Overshoot and Undershoot Specifications" on section 1.2.4.

1.2.4 AC Overshoot and Undershoot Specifications

	n opcoi	noution	
Parameter		Specification	Unit
maximum peak amplitude allowed for overshoot area.	Max.	0.3	V
maximum peak amplitude allowed for undershoot area.	Max.	0.3	V
maximum overshoot area above VDD/VDDQ	Max.	0.1	V-ns
maximum undershoot area below VSS/VSSQ	Max.	0.1	V-ns

Table — LPDDR4 Overshoot/Undershoot Specification

Figure — AC Overshoot and Undershoot Definition

1.2.5 Differential Input Voltage 1.2.5.1 Differential Input Voltage for CK

The minimum input voltage need to satisfy both Vindiff_CK and Vindiff_CK /2 specification at input receiver and their measurement period is 1tCK. Vindiff_CK is the peak to peak voltage centered on 0 volts differential and Vindiff_CK /2 is max and min peak voltage from 0V.

Figure — CK Differential input voltage

Table — CK Differential input voltage

				Data	Rate				
Parameter	Symbol	1600/1867		2133/2400/3200		/3200 3733/4267		Unit	Notes
		Min	Max	Min	Max	Min	Max		
CK differential input voltage	Vindiff_CK	420	-	380	-	360	-	mV	1
Nata	····•··		1		1				L

Notes:

1. The peak voltage of Differential CK signals is calculated in a following equation.

Vindiff_CK = (Max Peak Voltage) - (Min Peak Voltage)

Max Peak Voltage = Max(f(t)) Min Peak Voltage = Min(f(t))

 $f(t) = VCK_t - VCK_c$

1.2.5.2 Differential Input Voltage for DQS

The minimum input voltage need to satisfy both Vindiff_DQS and Vindiff_DQS /2 specification at input receiver and their measurement period is 1UI(tCK/2). Vindiff_DQS is the peak to peak voltage centered on 0 volts differential and Vindiff_DQS /2 is max and min peak voltage from 0V

Table — Differential AC and DC Input Levels

				Data	Rate				
Parameter	Symbol	1600	/1867	2133/24	00/3200	3733	/4267	Unit	Notes
		Min	Max	Min	Max	Min	Max		
DQS differential input	Vindiff_DQS	360	-	360	-	340	-	mV	1
Nataai									

Notes:

1. The peak voltage of Differential CK signals is calculated in a following equation.

Vindiff_DQS = (Max Peak Voltage) - (Min Peak Voltage)

Max Peak Voltage = Max(f(t))

Min Peak Voltage = Min(f(t))

 $f(t) = VDQS_t - VDQS_c$

1.2.6 Differential Input Cross Point Voltage

VDDQ ---

Figure — DQS input cross-point voltage (V)VIX Definition

Parameter	Symbol	Min /		Data rate		Unit	Note
Falameter	Symbol	Max	1600/1867	2133/2400/3200	3733/4267	Unit	note
DQS Differential input cross- point voltage ratio	Vix_DQS_ratio	Max	20	20	20	%	1,2
Notes:							

Table — DQS input voltage cross-point (Vix) ratio

1. The Vix voltage is referenced to Vswing/2(avg)= 0.5(VDQS_t + VDQS_c) where the average is over tbd UI.

2. The ratio of the Vix pk voltage divided by Vdiff_DQS : Vix_DQS_Ratio = 100* (Vix_DQS/Vdiff DQS pk-pk) where VdiffDQS $pk-pk = 2^*|VDQS_t - VDQS_c|$.

Figure — CK input cross-point voltage (Vix)

Deremeter	Symbol	Min /		Data rate		Linit	Note
Parameter	Symbol	Max	1600/1867	2133/2400/3200	3733/4267	Unit	Note
CK Differential input cross- point voltage ratio	Vix_CK_ratio	Max	25	25	25	%	1,2

Notes:

- 1. The Vix voltage is referenced to Vswing/2(avg)= 0.5(VCK_t + VCK_c) where the average is over tbd UI.
- 2. The ratio of the Vix pk voltage divided by Vdiff_CK : Vix_CK_Ratio = 100* (Vix_CK/Vdiff CK pk-pk) where VdiffCK pk-pk = 2*|VCK_t VCK_c|

1.2.6.1 Single Ended Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between VOL(AC) and VOH(AC) for single ended signals as shown in Table 14 and Figure 8.

Description	Meas	sured	Defined by
Description	from	to	Defined by
Single-ended output slew rate for rising edge	VOL(AC)	VOH(AC)	[VOH(AC) – VOL(AC)] / DeltaTRse
Single-ended output slew rate for falling edge	VOH(AC)	VOL(AC)	[VOH(AC) – VOL(AC)] / DeltaTFse

Figure — Single Ended Output Slew Rate Definition

Parameter	Symbol	min.	max.	Unit
Single-ended Output Slew Rate (VOH = VDDQ/3)	SRQse	3.5	9.0	V/ns
Output slew-rate matching Ratio (Rise to Fall)		0.8	1.2	

Remark: SR: Slew Rate, Q: Query Output (like in DQ, which stands for Data-in, Query-Output), se: Single-ended Signals

Notes:

- 1. Measured with output reference load.
- 2. The ratio of pull-up to pull-down slew rate is specified for the same temperature and voltage, over the entire temperature and voltage range. For a given output, it represents the maximum difference between pull-up and pulldown drivers due to process variation.
- 3. The output slew rate for falling and rising edges is defined and measured between VOL(AC) and VOH(AC).
- 4. Slew rates are measured under normal SSO conditions, with 1/2 of DQ signals per data byte driving logic high and 1/2 of DQ signals per data byte driving logic low.

1.2.7 Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between VOLdiff(AC) and VOHdiff(AC) for differential signals as shown in Table 16 and Figure 9.

Description	Meas	sured	Defined by
Description	from	to	Defined by
Differential output slew rate for rising edge	VOLdiff(AC)	VOHdiff(AC)	[VOHdiff(AC) – VOLdiff(AC)] / DeltaTRdiff
Differential output slew rate for falling edge	VOHdiff(AC)	VOLdiff(AC)	[VOHdiff(AC) – VOLdiff(AC)] / DeltaTFdiff

Table — Differential Output Slew Rate Definition

Note: 1. Output slew rate is verified by design and characterization, and may not be subject to production test.

Figure — Differential Output Slew Rate Definition

|--|

Parameter	Symbol	min.	max.	Unit
fferential Output Slew Rate (VOH=VDDQ/3)	SRQdiff	7	18	V/ns
		• •	~	

Remark: SR: Slew Rate, Q: Query Output (like in DQ, which stands for Data-in, Query-Output), diff: Differential Signals

Notes:

Dif

1. Measured with output reference load.

2. The output slew rate for falling and rising edges is defined and measured between VOL(AC) and VOH(AC).

3. Slew rates are measured under normal SSO conditions, with 1/2 of DQ signals per data byte driving logic high and 1/2 of DQ signals per data byte driving logic low.

1.3 Electrical Specifications

1.3.1 IDD Measurement Conditions

The following definitions are used within the IDD measurement tables: LOW: VIN \leq VIL(DC) max. HIGH: VIN \geq VIH(DC) min. STABLE: Inputs are stable at a HIGH or LOW level

					<u> </u>		-				
	Switching for CA										
CK_t edge	R1	R2	R3	R4	R5	R6	R7	R8			
CKE	HIGH	HIGH	HIGH	HIGH	HIGH	HIGH	HIGH	HIGH			
CS	LOW	LOW	LOW	LOW	LOW	LOW	LOW	LOW			
CA0	HIGH	LOW	LOW	LOW	LOW	HIGH	HIGH	HIGH			
CA1	HIGH	HIGH	HIGH	LOW	LOW	LOW	LOW	HIGH			
CA2	HIGH	LOW	LOW	LOW	LOW	HIGH	HIGH	HIGH			
CA3	HIGH	HIGH	HIGH	LOW	LOW	LOW	LOW	HIGH			
CA4	HIGH	LOW	LOW	LOW	LOW	HIGH	HIGH	HIGH			
CA5	HIGH	HIGH	HIGH	LOW	LOW	LOW	LOW	HIGH			

Table — Definition of Switching for CA Input Signals

Notes:

1. CS must always be driven LOW.

2. 50% of CA bus is changing between HIGH and LOW once per clock for the CA bus.

3. The above pattern is used continuously during IDD measurement for IDD values that require switching on the CA bus.

Clock Cycle Number	CKE	CS	Command	CA0	CA1	CA2	CA3	CA4	CA5
N	HIGH	HIGH	Read-1	L	Н	L	L	L	L
N+1	HIGH	LOW	Read-1	L	Н	L	L	L	L

Table — Data pattern for IDD4W (DBI off) for BL = 16

Notes:

1. Simplified pattern compared with last showing.

2. Same data pattern was applied to DQ[4], DQ[5], DQ[6], DQ[7] for reducing complexity for IDD4W/R pattern programming.

1.3.2 IDD Specifications

IDD values are for the entire operating voltage range, and all of them are for the entire standard range, with the exception of IDD6ET which is for the entire extended temperature range.

Table — IDD Specification Parameters and Operating Conditions-Single Die

				DR4		
Parameter/Condition	Symbol	Power Supply	3733/4266 (Standard)	4266 (Industrial Temperature)	Units	Notes
Operating one bank active-precharge current:	IDD01	VDD1	5.00	5.00	mA	
tCK = tCKmin; tRC = tRCmin;	IDD02	VDD2	26.00	32.00	mA	
CKE is HIGH;						
CS is LOW between valid commands;

Table – IDD6 Full-Array Self Refresh Current Single Die x16 Mode (16Gb Single-Channel Die)

					<u></u>
Temperature	Power Supply	LPD	DR4	Units	Notes
remperature	Power Suppry	3733	4266	Units	NOLES
	VDD1	0.52	0.65	mA	6,7,9
25 °C	VDD2	1.16	1.33	mA	6,7,9
	VDDQ	0.01	0.02	mA	4,6,7,9
	VDD1	4.30	4.30	mA	6,7,9
85 °C	VDD2	9.00	9.00	mA	6,7,9
	VDDQ	0.75	0.75	mA	4,6,7,9
	VDD1	-	5.00	mA	6,7,9
95 °C	VDD2	-	19.00	mA	6,7,9
	VDDQ	-	0.75	mA	4,6,7,9

Notes:

1. Published IDD values are the maximum of the distribution of the arithmetic mean.

2. ODT disabled: MR11[2:0] = 000B.

3. IDD current specifications are tested after the device is properly initialized.

4. Measured currents are the summation of VDDQ and VDD2.

5. Guaranteed by design with output load = 5pF and RON = 40 ohm.

6. This is the general definition that applies to full array Self Refresh.

7. Supplier datasheets may contain additional Self Refresh IDD values for temperature subranges within the Standard or elevated Temperature Ranges.

8. For all IDD measurements, VIHCKE = 0.8 x VDD2, VILCKE = 0.2 x VDD2.

9. IDD6 85/95°C is guaranteed, IDD6 25/105°C is typical of the distribution of the arithmetic mean.

10. IDD6ET is a typical value, is sampled only, and is not tested.

1.3.3 AC Timing Parameters

Parameter	Oursehad	min/	Data Rate	Nati
raiametei	Symbol	max	533 1066 1600 2133 2667 3200 3733 4267 Unit	Note
ACTIVE to ACTIVE command period	tRC	min	tRAS + tRPab (with all-bank precharge) tRAS + tRPpb (with per-bank precharge)	
Minimum Self-Refresh Time (Entry to Exit)	tSR	min	max(15ns, 3nCK) ns	
Self Refresh exit to next valid command delay	tXSR	min	max(tRFCab + 7.5ns, 2nCK) ns	
Exit power down to next valid command delay	tXP	min	max(7.5ns, 5nCK) ns	
CAS to CAS delay	tCCD	min	8 tCK(av	g)
CAS to CAS delay (Masked Write w/ECC)	tCCDMW	min	32 tCK(av	g)
Internal Read to Precharge command delay	tRTP	min	max(7.5ns, 8nCK) ns	
RAS to CAS Delay	tRCD	min	max(18ns, 4nCK) ns	
Row Precharge Time (single bank)	tRPpb	min	max(18ns, 3nCK) ns	
Row Precharge Time (all banks) - 8-bank	tRPab	min	max(21ns, 3nCK) ns	
Down Active Time	40.40	min	max(42ns, 3nCK) ns	
Row Active Time	tRAS	max	min(9 * tREFI * Refresh Rate, 70.2) us	
Write Recovery Time	tWR	min	max(18ns, 4nCK) ns	
Write to Read Command Delay	tWTR	min	max(10ns, 8nCK) ns	
Active bank A to Active bank B	tRRD	min	max(10ns, 4nCK) max(10ns, 4nCK) max(7.5n s,4n CK)	1
Precharge to Precharge Delay	tPPD	min	4 tCK	2
Four Bank Activate Window	tFAW	min	40 30 ns	1
Delay from SRE command to CKE input LOW Notes:	tESCKE	min	max(1.75ns, 3nCK) -	3

Table — Core Parameters

Notes:

1. 4267 Mbps timing value is supported at lower data rates if the device is supporting 4266 Mbps speed grade.

2. Precharge to precharge timing restriction does not apply to Auto-Precharge commands.

3. Delay time has to satisfy both analog time (ns) and clock count (nCK). It means that tESCKE will not expire until CK has toggled through at least three full cycle (3 tCK) and 1.75ns has transpired. The case which 3nCK is applied to is shown below.

Parameter	Symbol	min/max	LPDDR4 1600	LPDDR4 3200	LPDDR4 3733	LPDDR4 4267	Unit	Note

Table — DQ Tx Voltage and Timings	(Read Timing parameters)
-----------------------------------	--------------------------

Notes:

- Includes DRAM process, voltage and temperature variation. It includes the AC noise impact for frequencies > 20 MHz and max voltage of 45 mV pk-pk from DC-20 MHz at a fixed temperature on the package. The volage supply noise must comply to the component Min-Max DC Operating conditions.
- 2. tDQSCK_volt max delay variation as a function of DC voltage variation for VDDQ and VDD2. tDQSCK_volt should be used to calculate timing variation due to VDDQ and VDD2 noise < 20 MHz. Host controller do not need to account for any variation due to VDDQ and VDD2 noise > 20 MHz. The voltage supply noise must comply to the component Min-Max DC Operating conditions. The voltage variation is defined as the Max[abs{tDQSCKmin@V1-tDQSCKmax@V2}, abs{tDQSCKmax@V1-tDQSCKmin@V2}] / abs{V1-V2}. For tester measurement VDDQ = VDD2 is assumed.
- 3. tDQSCK_temp max delay variation as a function of Temperature.
- 4. The same voltage and temperature are applied to tDQS2CK_rank2rank.
- 5. tDQSCK_rank2rank parameter is applied to multi-ranks per byte lane within a package consisting of the same design dies.
- 6. DQ to DQS differential jitter where the total includes the sum of deterministic and random timing terms for a specified BER.
- 7. The deterministic component of the total timing.
- 8. This parameter will be characterized and guaranteed by design.
- 9. tQSL describes the instantaneous differential output low pulse width on DQS_t DQS_c, as measured from on falling edge to the next consecutive rising edge.
- 10. tQSH describes the instantaneous differential output high pulse width on DQS_t DQS_c, as measured from on falling edge to thenext consecutive rising edge.
- 11. This parameter is function of input clock jitter. These values assume the min tCH(abs) and tCL(abs). When the input clock jitter min tCH(abs) and tCL(abs) is 0.44 or greater than tCK(avg), the min value of tQSL will be tCL(abs)-0.04 and tQSH will be tCH(abs)-0.04.
- 12. UI=tCK(avg)min/2

Table — DQ Tx Voltage and Timings (Write Timing parameters)

Notes:

1. Data Rx mask voltage and timing parameters are applied per pin and includes the DRAM DQ to DQS voltage AC noise impact for frequencies >250KHz at a fixed temperature on the package. The voltage supply noise must comply to the component Min-Max DC operating conditions.

2. The design specification is a BER <tbd. The BER will be characterized and extrapolated if necessary using a dual dirac method.

3. Rx mask voltage VdIVW total(max) must be centered around Vcent_DQ(pin_mid).

4. Rx differential DQ to DQS jitter total timing window at the VdIVW voltage levels.

5. Defined over the DQ internal Vref range. The Rx mask at the pin must be within the internal Vref DQ range irrespective of the input signal common mode.

6. Deterministic component of the total Rx mask voltage or timing. Parameter will be characterized and guaranteed by design. Measurement method TBD

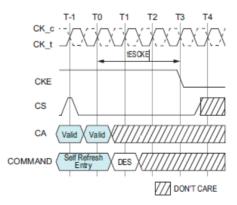

- 7. DQ only input pulse amplitude into the receiver must meet or exceed VIHL AC at any point over the total UI. No timing requirement above level. VIHL AC is the peak to peak voltage centered around Vcent_DQ(pin_mid) such that IHL_AC/2 min must be met both above and below Vcent_DQ.
- 8. DQ only minimum input pulse width defined at the Vcent_DQ(pin_mid).
- 9. DQ to DQS offset is within byte from DRAM pin to DRAM internal latch. Includes all DRAM process, voltage and temperature variation.
- 10. DQ to DQ offset defined within byte from DRAM pin to DRAM internal latch for a given component.
- 11. TDQS2DQ max delay variation as a function of temperature.
- 12. TDQS2DQ max delay variation as a function of the DC voltage variation for VDDQ and VDD2.
- 13. Input slew rate over VdIVW Mask centered at Vcent_DQ(pin_mid).
- 14. Rx mask defined for a one pin toggling with other DQ signals in a steady state.
- 15. VIHL_AC does not have to be met when no transitions are occurring.
- 16. UI=tCK(avg)min/2
- 17. The same voltage and temperature are applied to tDQS2DQ_rank2rank
- 18. tDQS2DQ_rank2rank parameter is applied to multi-ranks per byte lane within a package consisting of the same design dies.
- A. The following Rx voltage and timing requirements apply for all DQ operating frequencies at or below 1600 for all speed bins. The timing parameters in UI can be converted to absolute time values where tck(avg)min/2= 625ps for DQ=1600. For example the TdIVW_total(ps) =0.22*625ps= 137.5ps.

Table — Self-Refresh Timing Parameters

Parameter	Cumhal		Data Rate	ال ما ا	Nata
	Symbol	min/max	533 1066 1600 2133 2667 3200 3733 4267	Unit	Note
Delay from Self Refresh Entry to CKE Input Low	tESCKE	min	max(1.75ns,3tCK) r	nCK	1
Minimum Self-Refresh Time (Entry to Exit)	tSR	min	max(15ns, 3nCK)	ns	1
Self refresh exit to next valid command delay	tXSR	min	max(tRFCab + 7.5ns, 2nCK)	ns	1,2

Note

 Delay time has to satisfy both analog time(ns) and clock count(tCK). It means that tESCKE will not expire until CK has toggled through at least 3 full cycles (3 *tCK) and 1.75ns has transpired. The case which 3tCK is applied to is shown below.

2. MRR-1, CAS-2, SRX, MPC, MRW-1, and MRW-2 commands (except PASR bank/segment setting) are only allowed during this period.

Parameter	Symbol	min/ max	DQ-1333 ^{A)}	DQ- 1600/1867	DQ- 3200/3733	DQ-4266	Unit	Note
Rx Mask voltage p-p	VcIVW	max	175	175	155	145	mV	1,2,4

CA input pulse width	TcIPW	min	0.55	0.55	0.6	0.6	UI	6
Input slew rate over VcIVW	SRIN_cIVW	min	1	1	1	1	V/ns	7
		max	7	7	7	7	v/ns	1

Table — Command Address Input Parameters

Notes:

1. CA Rx mask voltage and timing parameters at the pin including voltage and temperature drift.

2. Rx mask voltage VcIVW total(max) must be centered around Vcent_CA(pin mid).

- 3. Rx differential CA to CK jitter total timing window at the VcIVW voltage levels.
- 4. Defined over the CA internal Vref range. The Rx mask at the pin must be within the internal Vref CA range irrespective of the input signal common mode.
- 5. CA only input pulse signal amplitude into the receiver must meet or exceed VIHL AC at any point over the total UI. No timing requirement above level. VIHL AC is the peak to peak voltage centered around Vcent_CA(pin mid) such that VIHL_AC/2 min must be met both above and below Vcent_CA.
- 6. CA only minimum input pulse width defined at the Vcent_CA(pin mid).
- 7. Input slew rate over VcIVW Mask centered at Vcent_CA(pin mid).
- 8. VIHL_AC does not have to be met when no transitions are occurring.
- 9. UI=tCK(avg)min
- A. The following Rx voltage and timing requirements apply for DQ operating frequencies at or below 1333 for all speed bins. The timing parameters in UI can be converted to absolute time values where tck(avg)min= 1.5ns for DQ=1333. For example the TclVW(ps) = 0.3*1.5ns=450ps.

Table — Command Bus Training Parameters	mand Bus Training Paramet	ers
-----------------------------------------	---------------------------	-----

Notes:

1. DQS_t has to retain a low level during tDQSCKE period, as well as DQS_c has to retain a high level.

2. If tCACD is violated, the data for samples which violate tCACD will not be available, except for the last sample (where tCACD after this sample is met). Valid data for the last sample will be available after tADR.

Parameter	Current of	min/			Data	Rate			Linit	Mata

Write leveling invalid window	tWLIVW_Total	min	240 160 160 120 105 90							1,2

Table — Write Leveling Parameters

Notes:

1. In addition to the traditional setup and hold time specifications above, there is value in a invalid window based specification for write-leveling training. As the training is based on each device, worst case process skews for setup and hold do not make sense to close timing between CK and DQS.

2. tWLIVW_Total is defined in a similar manner to tdIVW_Total, except that here it is a DQS invalid window with respect to CK. This would need to account for all VT (voltage and temperature) drift terms between CK and DQS within the DRAM that affect the write-leveling invalid window.

The DQS input mask for timing with respect to CK is shown in the following figure. The "total" mask (TdiVW_total) defines the time the input signal must not encroach in order for the DQS input to be successfully captured by CK with a BER of lower than tbd. The mask is a receiver property and it is not the valid data-eye.

Figure — DQS_t/DQS_c and CK_t/CK_c at DRAM Latch

Table — Frequency Set Point Timing

Parameter	Symbol	min/				Data I	Rate				Unit	Not
	Gymbol	max		1066	1600	2133	2667	3200	3733	4267	Onit	е
	tFC_Short	min				20	0				ns	1
Frequency Set Point Switching Time	tFC_Middle	Middle min 200					ns	1				
	tFC_Long	min	250									1
Valid Clock Requirement after entering FSP change	tCKFSPE	min	max(7.5ns, 4nCK)									
Valid Clock Requirement before 1st valid ommand after FSP change	tCKFSPX	min			max	:(7.5n:	s, 4nC	CK)				

Notes:

1. Frequency Set Point Switching Time depends on value of Vref(ca) setting: MR12 OP[5:0] and Vref(ca) Range: MR12 OP[6] of FSPOP

0 and 1. The details are shown in Table "tFC value maping".

Additionally change of Frequency Set Point may affect Vref(dq) setting. Setting time of Vref(dq) level is same as Vref(ca) level.

Notes

- 1. All LPDDR4 commands except for Deselect are 2 clock cycle long and defined by states of CS and CA[5:0] at the first rising edge of clock. Deselect command is 1 clock cycle long.
- 2. "V" means "H" or "L" (a defined logic level). "X" means don't care in which case CS, CK_t, CK_c and CA[5:0] can be floated.
- 3. Bank addresses BA[2:0] determine which bank is to be operated upon.
- 4. AB "HIGH" during Precharge or Refresh command indicates that command must be applied to all banks and bank address is a don't care.
- 5. Mask Write-1 command supports only BL 16. For Mark Write-1 comamnd, CA5 must be driven LOW on first rising clock cycle (R1).
- 6. AP "HIGH" during Write-1, Mask Write-1 or Read-1 commands indicates that an auto-precharge will occur to the bank associated with the Write, Mask Write or Read command.
- 7. If Burst Length on-the-fly is enabled, BL "HIGH" during Write-1 or Read-1 command indicates that Burst Length should be set on-the-Fly to BL=32. BL "LOW" during Write-1 or Read-1 command indicates that Burst Length should be set on-the-fly to BL=16. If Burst Length on-the-fly is disabled, then BL must be driven to defined logic level "H" or "L".
- 8. For CAS-2 commands (Write-2 or Mask Write-2 or Read-2 or MRR-2 or MPC (Only Write FIFO, Read FIFO & Read DQ Calibration), C[1:0] are not transmitted on the CA[5:0] bus and are assumed to be zero. Note that for CAS-2 Write-2 or CAS-2 Mask Write-2 command, C[3:2] must be driven LOW.
- 9. Write-1 or Mask Write-1 or Read-1 or Mode Register Read-1 or MPC (Only Write FIFO, Read FIFO & Read DQ Calibration) command must be immediately followed by CAS-2 command consecutively without any other command in between. Write-1 or Mask Write-1 or Read-1 or Mode Register Read-1 or MPC (Only Write FIFO, Read FIFO & Read DQ Calibration) command must be issued first before issuing CAS-2 command. MPC (Only Start & Stop DQS Oscillator, Start & Latch ZQ Calibration) commands do not require CAS-2 command; they require two additional DES or NOP commands consecutively before issuing any other commands.
- 10. Activate-1 command must be immediately followed by Activate-2 command consecutively without any other command in between. Activate-1 command must be issued first before issuing Activate-2 command. Once Activate-1 command is issued, Activate-2 command must be issued before issuing another Activate-1 command.
- 11. MRW-1 command must be immediately followed by MRW-2 command consecutively without any other command in between. MRW-1 command must be issued first before issuing MRW-2 command.
- 12. MRR-1 command must be immediately followed by CAS-2 command consecutively without any other command in between. MRR-1 command must be issued first before issuing CAS-2 command.

NOTE 2 Top View, A1 in top left corner.

NOTE 3 ODT(ca)_[x] balls are wired to ODT(ca)_[x] pads of Rank 0 DRAM die. ODT(ca)_[x] pads for other ranks (if present) are disabled in the package.

NOTE 4 ZQ2, CKE2_A, CKE2_B, CS2_A, and CS2_B balls are reserved for 3-rank package. For 1-rank and 2-rank package those balls are NC. NOTE 5 Die pad VSS and VSSQ signals are combined to VSS package balls.

NOTE 6 Package requires dual channel die or functional equivalent of single channel die-stack.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR MOS DEVICES

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

(2) HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Kingston Technology Company, Inc.

Kingston Technology Company, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Kingston Technology Company, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Kingston Technology Company, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Kingston Technology Company, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product

applications]

Be aware that this product is for use in typical electronic equipment for general-purpose applications. Kingston Technology Company, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, this product is not intended for use in the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury. Customers are instructed to contact Kingston Technology Company's sales office before using this product for such applications.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Kingston Technology Company, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Kingston Technology Company, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Kingston Technology Company, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Kingston Technology Company, Inc. product.

[Usage environment]

Usage in environments with special characteristics as listed below was not considered in the design.

Accordingly, our company assumes no responsibility for loss of a customer or a third party when used in environments with the special characteristics listed below.

Example:

- Usage in liquids, including water, oils, chemicals and organic solvents.
 Usage in exposure to direct sunlight or the outdoors, or in dusty places.
- 3) Usage involving exposure to significant amounts of corrosive gas, including sea air, CL2, H2S, NH3, SO2, and NOX.
 4) Usage in environments with static electricity, or strong electromagnetic waves or radiation.
- 5) Usage in places where dew forms.
- 6) Usage in environments with mechanical vibration, impact, or stress.
- 7) Usage near heating elements, igniters, or flammable items.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Taiwan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Taiwan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
