

5-V, Zero-Drift, RRIO, 15-MHz, Precision Operational Amplifiers

Features

- Supply Voltage: 2.7 V to 5.5 V
- Dual Supply: ± 1.35 V to ± 2.75 V
- Low Offset Voltage: ± 20 μ V (Max)
- Zero Drift: ± 0.01 μ V/ $^{\circ}$ C
- Rail-to-Rail Input and Output
- Gain Bandwidth Product: 15 MHz
- Slew Rate: 4.9 V/ μ s
- Low Noise: 10 nV/ \sqrt Hz at 1 kHz
- No 1/f noise: 0.2 μ V_{PP} (0.1 Hz to 10 Hz)

Applications

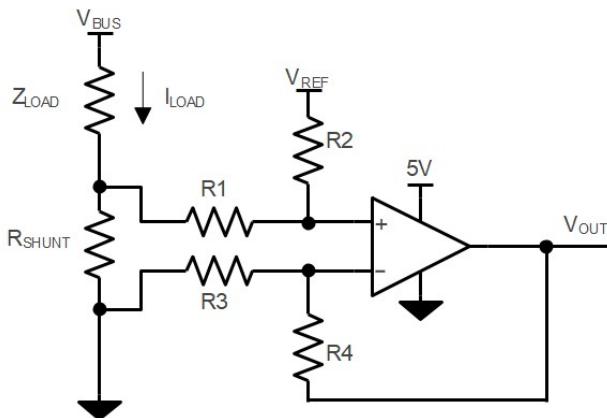

- Server PSU
- Battery Current Sensing
- Precision Signal Condition
- Power System
- Temperature Transmitter
- Medical Instrumentation

Description

The TPA558x is the newest zero-drift amplifier with a maximum 20- μ V low-offset voltage, low noise, and stable high-frequency response. It incorporates proprietary and patented design techniques to achieve excellent AC performance with 15-MHz bandwidth, 4.9-V/ μ s slew rate, and low distortion while drawing 1-mA quiescent current per amplifier. The input common-mode voltage extends to V_- , and the output swings rail-to-rail. The amplifier can be used as a plug-in replacement for commercially available op-amps to improve performance. Considering the requirements of the low standby power in some special applications, there is a shutdown function which is the TPA558xN series with only 7.5- μ A shutdown current.

The TPA5581 and TPA5581U (1-ch version) are offered in the SOT23-5 and SOT353-5 (SC70-5) packages. The TPA5582 (2-ch version) is available in the SOP8, TSSOP8, MSOP8, DFN2X2-8, and DFN3X3-8 packages. The TPA5581N (shutdown version) is only offered in the SOT23-5 package. All versions are operated over the industrial temperature range from -40° C to $+125^{\circ}$ C.

Typical Application Circuit

$$V_{OUT} = (I_{LOAD} \times R_{SHUNT}) \times (R_2 / R_1) + V_{REF}$$

When $R_3 = R_1$, $R_2 = R_4$, $R_{SHUNT} \ll R_1$

5-V, Zero-Drift, RRIO, 15-MHz, Precision Operational Amplifiers**Revision History**

Date	Revision	Notes
2022-12-22	Rev.A.0	Initial version.
2023-07-31	Rev.A.1	Updating the curve of the Open-Loop Gain and Phase Margin vs. Frequency.
2023-12-22	Rev.A.2	Updating the max value of I_{OS} under room temperature.
2024-04-28	Rev.A.3	Removed the label of TPA5582-TS1R indicating future products in Order Information.
2024-12-18	Rev.A.4	Changed the status of the TPA5581U-S5TR, TPA5581U-SC5R to production in the Order Information. Corrected handwriting errors. The physical object has not changed.

Pin Configuration and Functions

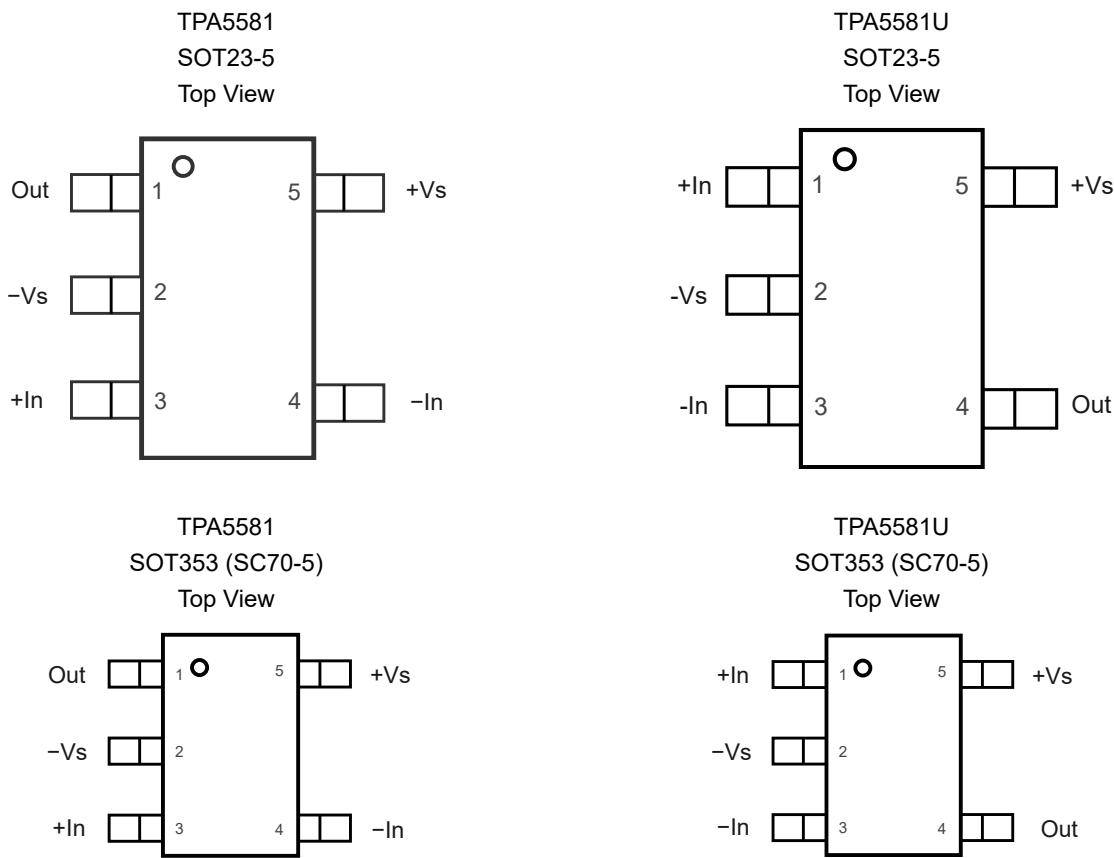

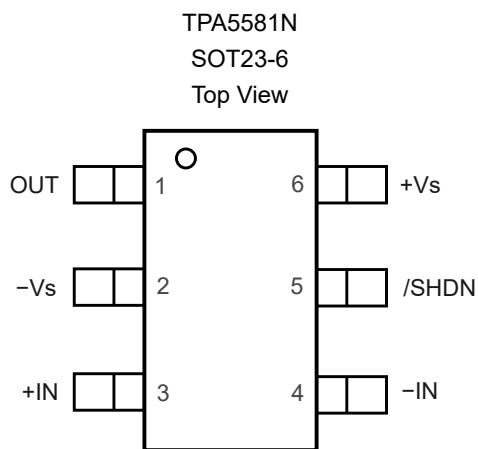

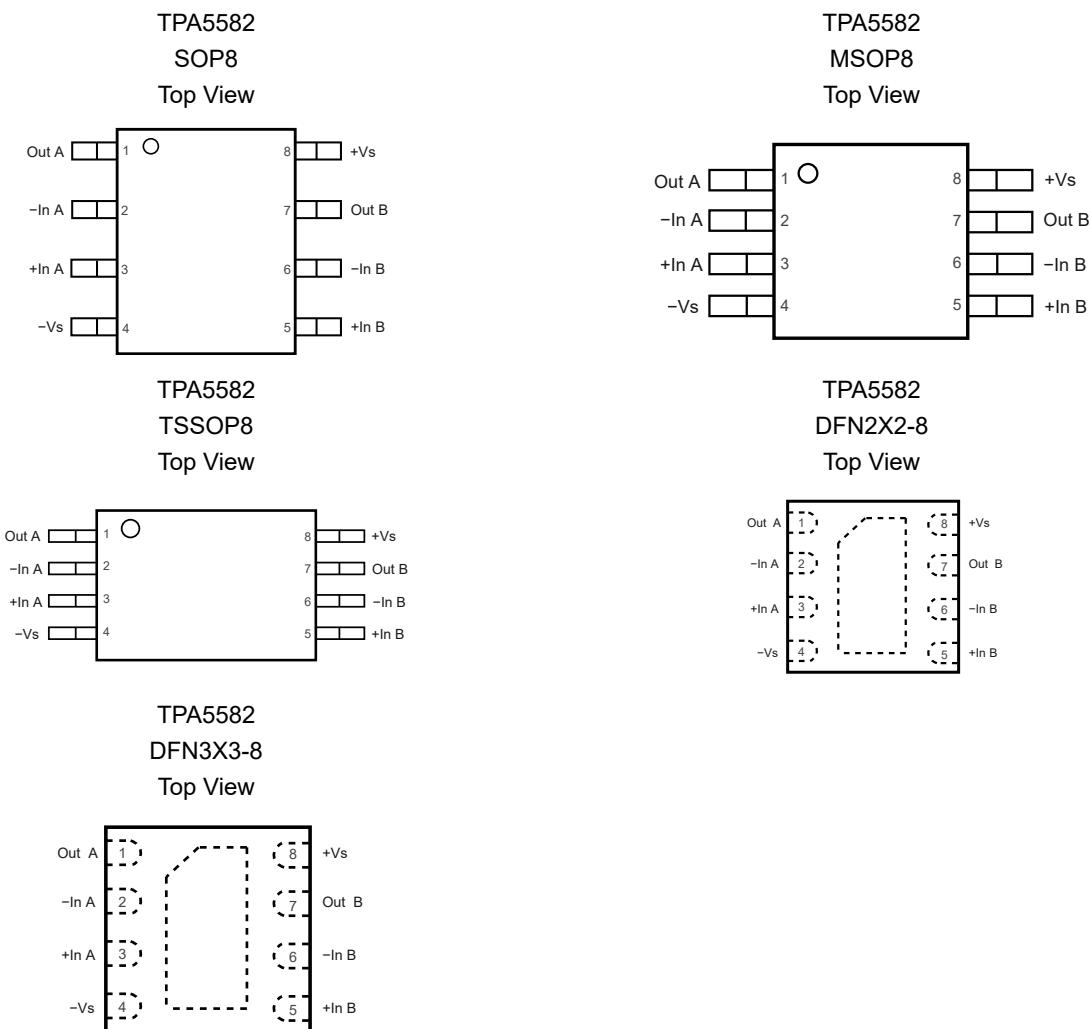

Table 1. Pin Functions: TPA5581, TPA5581U

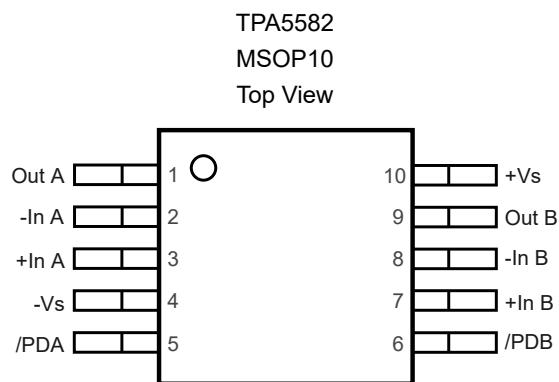

Pin No.		Name	I/O	Description
TPA5581	TPA5581U			
1	4	Out	O	Output
2	2	-Vs		Negative power supply
3	1	+In	I	Noninverting input
4	3	-In	I	Inverting input
5	5	+Vs		Positive power supply

Specifications

Absolute Maximum Ratings (1)

All test conditions: over operating ambient temperature, unless otherwise noted.

Symbol	Parameter	Min	Max	Unit
	Supply Voltage, (+Vs) – (–Vs)		6.5	V
	Input Voltage	(–Vs) – 0.3	(+Vs) + 0.3	V
	Differential Input Voltage	(–Vs) – (+Vs)	(+Vs) – (–Vs)	V
	Input Current: +IN, –IN ⁽²⁾	-10	10	mA
	Output Voltage	(–Vs) – 0.3	(+Vs) + 0.3	V
	Output Short-Circuit Duration ⁽³⁾		Infinite	
T _J	Maximum Junction Temperature		150	°C
T _A	Operating Temperature Range	-40	125	°C
T _{STG}	Storage Temperature Range	-65	150	°C
T _L	Lead Temperature (Soldering, 10 sec)		260	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

(2) The inputs are protected by ESD protection diodes to negative power supply. If the input extends more than 300 mV beyond the negative power supply, the input current should be limited to less than 10 mA.

(3) A heat sink may be required to keep the junction temperature below the absolute maximum. This depends on the power supply voltage and how many amplifiers are shorted. Thermal resistance varies with the amount of PC board metal connected to the package. The specified values are for short traces connected to the leads.

ESD, Electrostatic Discharge Protection

Parameter		Condition	Minimum Level	Unit
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	3	kV
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002 ⁽²⁾	1.5	kV

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Detailed Description

Overview

The TPA558x is a series of zero-drift amplifiers that can operate on a single-supply voltage (2.7 V to 5.5 V), or a split-supply voltage. With a precision auto-calibration technique, these amplifiers achieve low input offset voltage and input offset voltage drift which can achieve outstanding input and output dynamic linearity. The strengths of TPA558x also include 15-MHz bandwidth, no 1/f noise, 10-nV/ $\sqrt{\text{Hz}}$ noise spectral density, and 1-mA quiescent current, making the TPA558x suitable for many precision and temperature sensitive applications. Parameters that exhibit variance with regard to operating voltage or temperature are presented in [Typical Performance Characteristics](#).

Functional Block Diagram

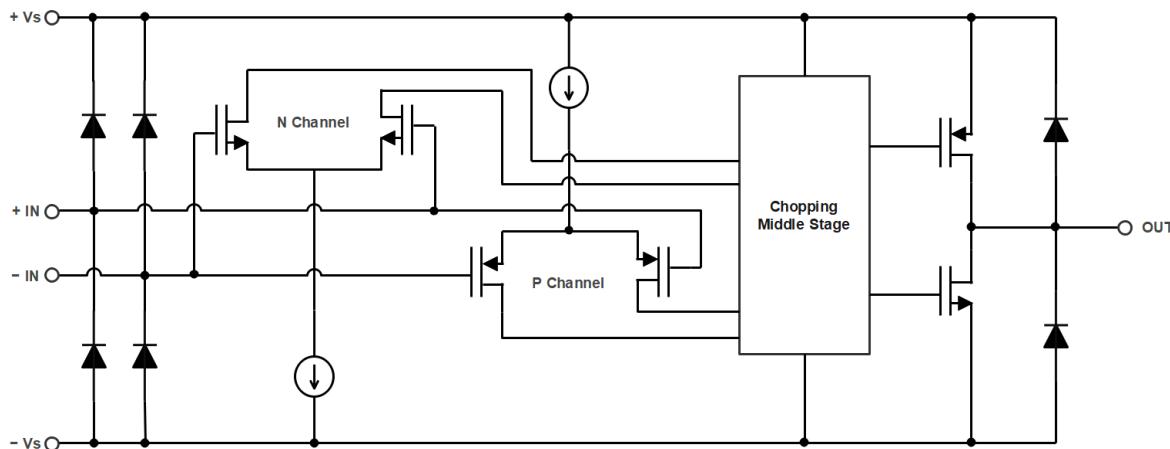

Figure 23. Functional Block Diagram

Feature Description

Operating Voltage

The TPA558x operational amplifier is designed for single-supply operation from 2.7 V to 5.5 V, or dual-supply operation from ± 1.35 V to ± 2.75 V.

Residual Voltage Ripple

The chopping technique can be used in amplifier design due to the internal notch filter. Although the chopping related voltage ripple is suppressed, a higher noise spectrum exists at the chopping frequency and its harmonics due to the residual ripple.

The devices set the chopping frequency to 400 kHz. If the frequency of input signal is close to the chopping frequency, the signal may be interfered by the residue ripple. To suppress the noise at the chopping frequency, it is recommended that a post filter be placed at the output of the amplifier.

Rail-to-Rail Input

The input common-mode voltage range of the TPA558x family extends 100 mV beyond the supply rails. This performance is achieved with a complementary input stage: a P-channel input differential pair in parallel with an N-channel differential pair. The P-channel pair is active for inputs from 100 mV below the negative supply to approximately $(+Vs) - 1.5$ V, whereas the N-channel pair is active for input voltages close to the positive rail, typically $(+Vs) - 1.5$ V to 100 mV above the positive

5-V, Zero-Drift, RRIO, 15-MHz, Precision Operational Amplifiers

supply. There is around 200-mV transition region at $(+Vs) - 1.5\text{ V}$ where both pairs are on. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD can degrade comparing to that operating outside this region.

Rail-to-Rail Output

The TPA558x family delivers rail-to-rail output swing capability with a class-AB output stage. Different load conditions change the ability of the amplifier to swing close to the rails.

Shutdown Function

The shutdown function of the TPA558x is only available in the TPA558xN series. The voltage level of this is referenced to the supply voltage of the operational amplifier. The operational amplifier is enabled with a valid high voltage and shutdown by a valid low voltage. When the single supply is used, a valid high level is defined as $0.7 \times (+Vs)$ of the positive supply and a valid low level is defined as $0.3 \times (+Vs)$ of the positive supply.

For example, with $+Vs$ at 5 V and $-Vs$ at 0 V, a valid high level is defined as 3.5 V and a valid low level is defined as 1.5 V. If dual or split power supplies are used, make sure the valid high or valid low input signals are properly referred to the positive supply voltage. For example, with $+Vs$ at 2.5 V and $-Vs$ at -2.5 V, a valid high level is defined as 1 V and a valid low level is defined as -1 V.

The pin of SHDN is internally pulled up to a valid high level when this pin is left open state, so the amplifier is enabled initially if nothing is connected to the shutdown pin. The output state of the amplifier is assumed as high-impedance state if shut down. The specific requirement and performance about this function are provided in the [Typical Performance Characteristics](#) (see [Figure 19](#) and [Figure 20](#)). The output state of the amplifier is assumed as high-impedance state if shut down.

Application and Implementation

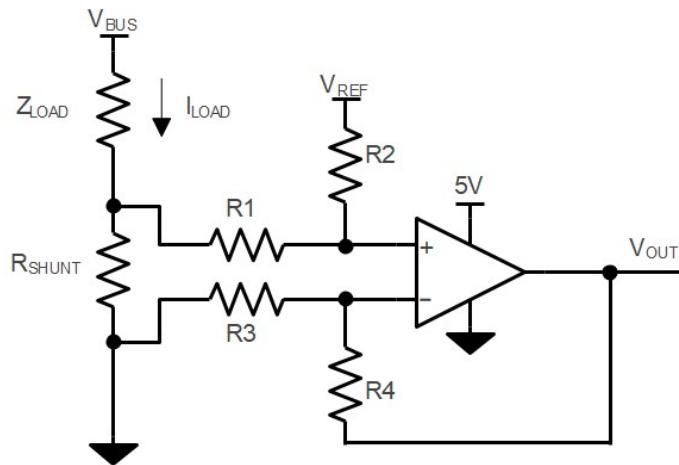

Note

Information in the following application sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

Application Information

Low-Side Current-Sensing Application

Figure 24 shows the device configured in a low-side current-sensing application. The low-side current-sensing method consists of placing a sense resistor between the load and the circuit ground. The voltage dropping across the resistor is amplified by different amplifier circuits with the device. V_{REF} can be used to add bias voltage to the output voltage. Particular attention must be paid to the matching and precision of R1, R2, R3, and R4, to maximize the accuracy of the measurement.

$$V_{OUT} = (I_{LOAD} \times R_{SHUNT}) \times (R_2 / R_1) + V_{REF}$$

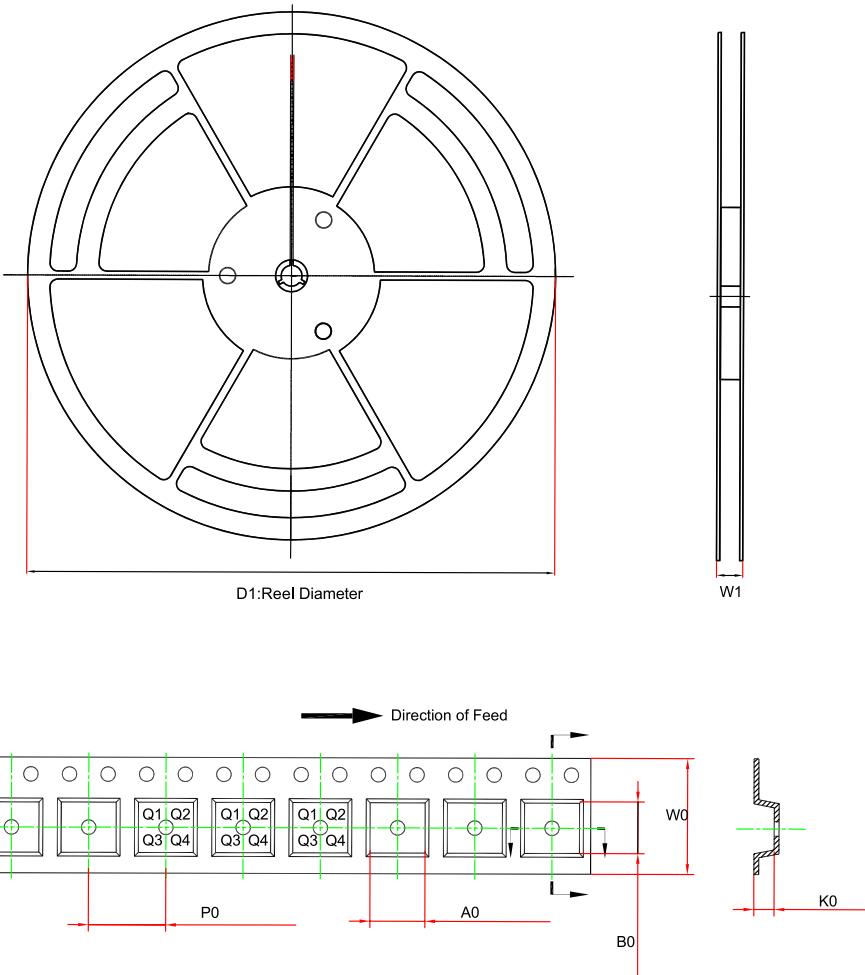

When $R_3 = R_1$, $R_2 = R_4$, $R_{SHUNT} \ll R_1$

Figure 24. Low-Side Current-Sensing Application

Power Supply Recommendations

Place 0.1- μ F bypass capacitors close to the power supply pins to reduce coupling errors from the noise or high-impedance power supplies.
