

## Features

- Supply Voltage: 2.3 V to 3.6 V
- 5-V Tolerant I/Os With Device Power Up or Power Down
- Device Isolation During Power Off
- Low ON-State Resistance:  
typical 4 Ω at  $V_{CC} = 3\text{ V}$
- Bandwidth: 400 MHz
- Break-Before-Make Switching
- Operation Temperature Range:  $-40^\circ\text{C}$  to  $125^\circ\text{C}$

## Applications

- SPI Routing
- Server
- Video Signal Routing
- Computer

## Description

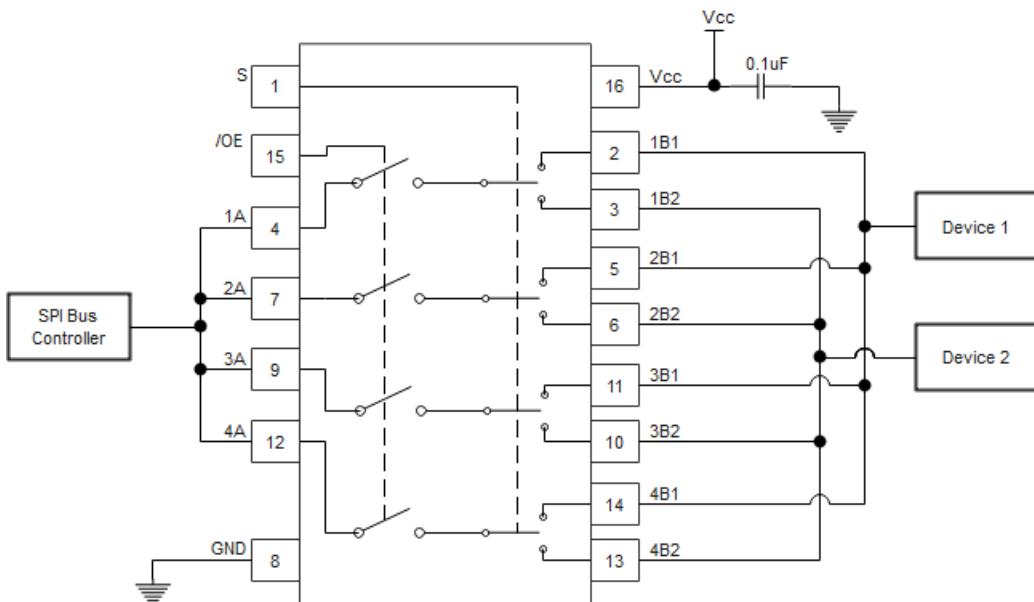

The TPW3257 device is a high-bandwidth bus switch utilizing a charge pump to provide a low and flat ON-state resistance.

The TPW3257 can be used to multiplex and de-multiplex up to 4 channels simultaneously in a 2:1 configuration. The /OE and S pins are used to control the chip from the bus controller.

The device has isolation during power off even when the signal exit on switch pin.

The  $V_{CC}$  operating range is from 2.3 V to 3.6 V and the switch pins support 0 V to 5 V signal levels.

## Specifications

### Absolute Maximum Ratings

Parameter	Min	Max	Unit
Supply Voltage, V <sub>cc</sub>	-0.5	4.6	V
Bus Switch Voltage	-0.5	7	V
Bus Switch Current	-100	100	mA
Bus Switch Diode Current		50	mA
Digital Input Voltage, /OE, S	-0.5	7	V
Digital Input Diode Current		50	mA
Maximum Junction Temperature		150	°C
Storage Temperature Range	-65	150	°C
Lead Temperature (Soldering, 10 sec)		260	°C

**Note:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

### ESD, Electrostatic Discharge Protection

Symbol	Parameter	Condition	Minimum Level	Unit
HBM	Human Body Model ESD	ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	2	kV
CDM	Charged Device Model ESD	ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	1	kV

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### Recommended Operating Conditions

Parameter		Min	Typ	Max	Unit
V <sub>cc</sub>	Supply Voltage	2.3		3.6	V
	Transition Rise and Fall Rate for Control Input			100	ns/V
	Switch I/O Port Voltage	0		5.5	V
	Operating Temperature Range	-40		125	°C

### Thermal Information

Package Type	θ <sub>JA</sub>	θ <sub>JC</sub>	Unit
16-Pin QSOP	100	50	°C/W

## Electrical Characteristics

$T_A = -40$  to  $125^\circ\text{C}$ , all typical values are at  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

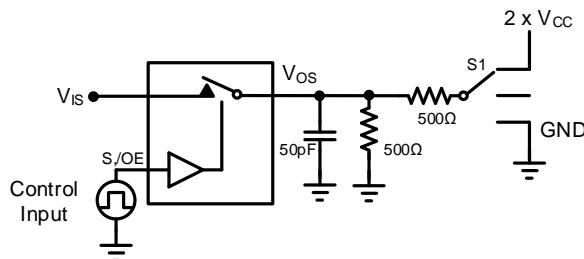

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Power Supply</b>						
I <sub>CC</sub>	Quiescent Supply Current	V <sub>CC</sub> = 3.6 V, V <sub>IN</sub> = 0 V or V <sub>CC</sub>			1.5	mA
ΔI <sub>CC</sub>	Increase in Supply Current	V <sub>CC</sub> = 3.6 V, V <sub>IN</sub> = 3.0 V			30	μA
<b>Digital Input (V<sub>IN</sub>)</b>						
V <sub>IH</sub>	Input Voltage High	V <sub>CC</sub> = 2.3 to 2.7 V	1.7		5.5	V

## Typical Performance Characteristics

## Detailed Description

### Overview

The TPW3257 device is a high-bandwidth bus switch using a charge pump to provide higher voltage for internal circuit than input power voltage ( $V_{cc}$ ). The design provides a low and flat ON-state resistance and low switch I/O capacitance, which allows for minimal propagation delay and supports high-bandwidth applications.

The TPW3257 device is organized as two 1-of-4 multiplexers/demultiplexers with single output-enable input (/OE) and single select input (S) control the data path of each multiplexer/demultiplexer. When /OE is low, the switch is enabled, and allows bidirectional data flow between A and B ports. When /OE is high, the switch is disabled, and a high-impedance state exists between the A and B ports.

### Functional Block Diagram

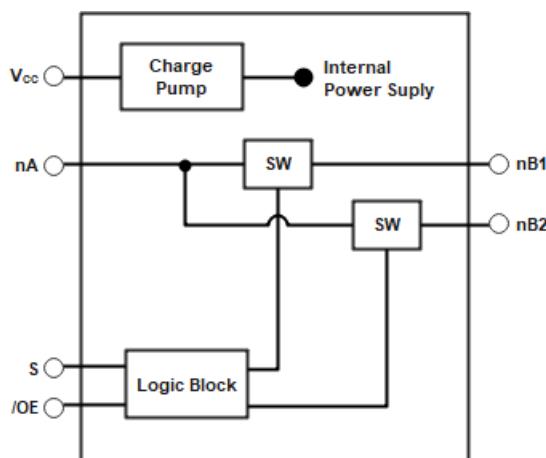

Figure 2 Functional Block Diagram

### Feature Description

#### Over Power Rail Input for Switch

This device with internal charge pump has switching pass ability on data I/O ports for 0 V to 5 V switching with 3.3 V  $V_{cc}$  and 0 V to 3.3 V switching with 2.5 V  $V_{cc}$ .

#### Isolation during Power Off

The device has isolation during power off, the internal circuit prevents current flow when the device is powered down and the voltage still be applied at A, B ports or control inputs (S, /OE).

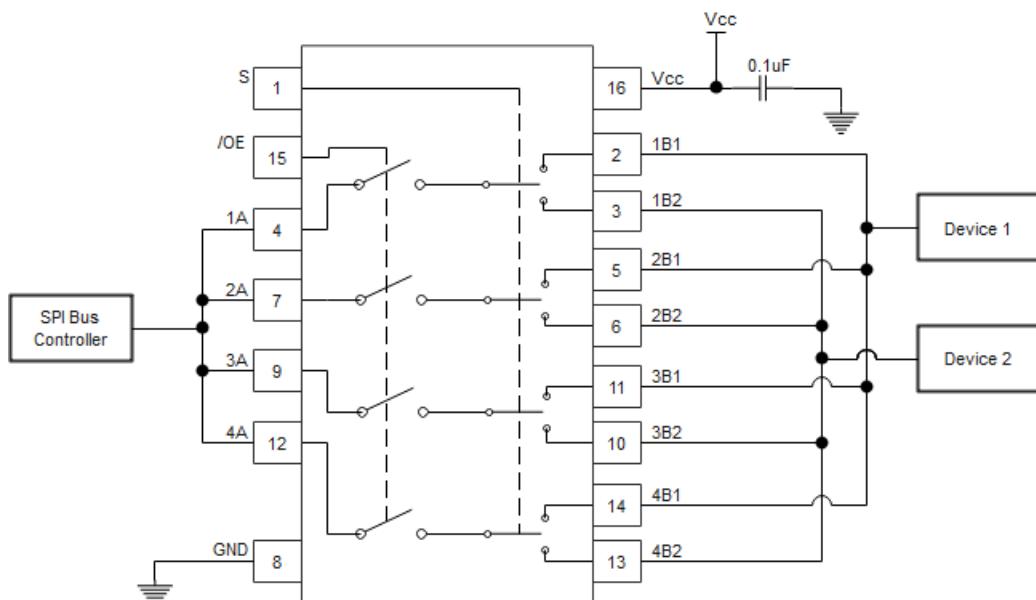

/OE should be tied to  $V_{cc}$  through a pullup resistor to ensure the high-impedance state during power up or power down.

## Application and Implementation

### NOTE

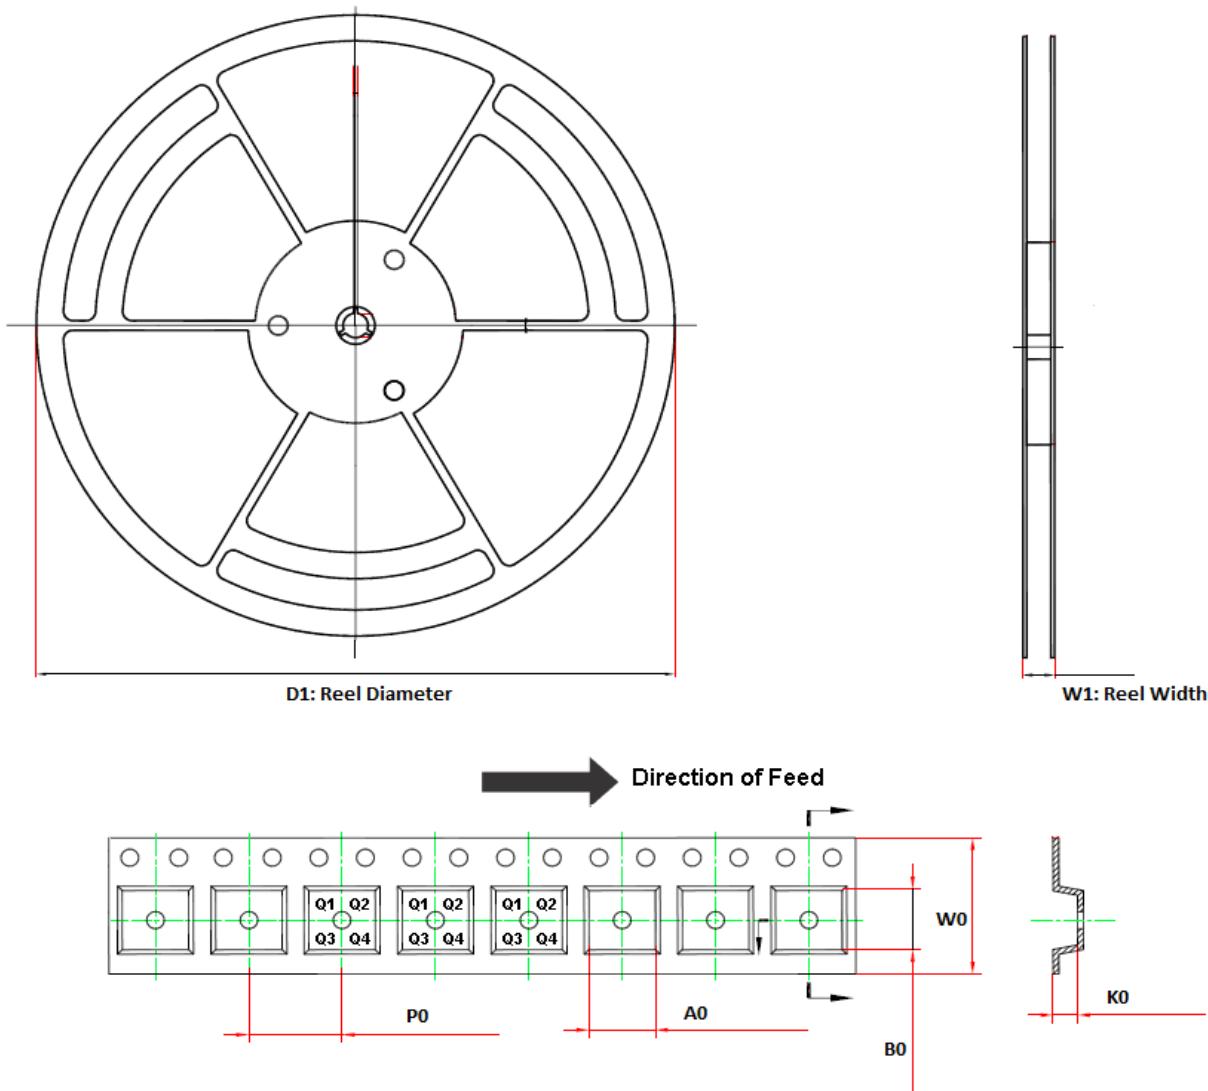

Information in the following applications sections is not part of the 3PEAK's component specification and 3PEAK does not warrant its accuracy or completeness. 3PEAK's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

The TPW3257 device can be used to multiplex and demultiplex up to 4 channels simultaneously in a 2:1 configuration. The application shown here is a 4-bit bus being multiplexed between two devices. The control inputs (*/OE* and *S*) are used to control the device by the bus controller. If an application requires less than 4 channels, the unused channels of A port should tie to either high or low.

**Figure 3 Typical Application**
